Glossary

A

**Acquiring Company**
A company which is attempting to purchase another company.

**Acquisition**
An Acquisition involves an Acquiring Company purchasing a Target Company without forming a new company.

**Alternatively Weighted Indices**
Indices whose constituents are weighted according to some formula or rule other than the weights derived from market capitalisation used in traditional Market Capitalisation Weighted Indices. They are designed to reflect the performance of investment strategies with specific diversification, risk reduction or factor objectives. FTSE Russell compiles the following alternatively weighted indices, amongst others:

**Factor (or Smart Beta) Indices**
Indices which weight constituents so as to mimic popular investment strategies which seek to capture the performance anomalies that have been observed historically to accrue to Value, Size, Quality and Momentum factors.

**Equally Weighted**
All index constituents have the same weight regardless of their market capitalisation or economic size.

**Fundamental**
Indices which select and weight constituent companies according to measures of fundamental value, for example: assets, revenue, earnings, sales or dividends.

**Minimum Variance**
An index in which constituents are selected and weighted in order to minimise the volatility of index level performance using historical data.

**Average Daily Dollar Trading Volume (ADDTV)**
A measure of liquidity used as an eligibility screen in the construction of certain Russell indices and for determining the most liquid country Home Country Indicator when assigning a company to a country. See the Russell US Equity Indices Construction and Methodology document for further details.
Basis Point
A unit of measurement, equal to 1/100th of 1%, or 0.01%

Benchmark
Historically the terms Benchmark and Index have been used interchangeably. Following the publication in July 2013 of the IOSCO Principles, the term Benchmark has taken a more specific meaning. The IOSCO definition is:

A Benchmark contains prices, estimates, rates, indices or values that are:

a. Made available to users, whether free of charge or for payment;
b. Calculated periodically, entirely or partially by the application of a formula or another method of calculation to, or an assessment of, the value of one or more underlying Interests;
c. Used for reference for purposes including one or more of the following:
   – determining the interest payable, or other sums due, under loan agreements or under other financial contracts or instruments;
   – determining the price at which a financial instrument may be bought or sold or traded or redeemed, or the value of a financial instrument; and/or
   – measuring the performance of a financial instrument.

The forthcoming European Regulation of Indices used as Benchmarks in Financial Instruments and Financial Contracts may adopt a related, but not identical, definition; it is possible that this definition will include: an Index that is used to measure the performance of an investment fund.

Benchmark Administrator
An organisation that takes responsibility for all stages of the calculation, determination and dissemination of a Benchmark. The IOSCO Principles and European Regulation contain such a definition.

Benefit Driven Incorporation (BDI)
Companies may choose to incorporate in certain countries for operational, tax, and political benefits. FTSE Russell identifies these countries as BDI countries. A list of these countries is provided in the Russell US Indices Construction and Methodology document. Companies that incorporate or headquarter in BDI countries are subject to specific treatment when determining their country assignment for Russell US index inclusion purposes.

Buffer Zone
See Percentile Banding.

Capped Index
A Capped Index limits the weight of any single security (industry or country) in the index. The aim is to prevent any single security (industry or country) having an excessive influence on the index.

Capped Weight
The level at which the weight of a constituent may be limited at an index review, if it exceeds a certain percentage within a Capped Index.
**Capital Index**

A *Capital Index* sometimes referred to as a *Price Index*, measures the aggregated price performance of constituents, weighted according to the index weighting strategy. Comparing the index at different points in time provides a measure of the change in the value of the market or segment which the Index is designed to represent. In contrast to a *Total Return Index*, a *Capital Index* does not take account of dividend income accruing to the constituents.

**Composite Value Score (CVS)**

A measure used to assign the weights to constituents of the Russell Value and Growth indices. See the Russell US Equity Indices Construction and Methodology document for further information.

**Constituent**

A security that is a member of an index.

**Corporate Action**

A *Corporate Action* occurs when there is a change to a company’s capital structure. Unlike *Corporate Events*, *Corporate Actions* have a prescribed ex-date. The share price will be subject to an adjustment on the ex-date and FTSE Russell will adjust the index *Divisor* to counteract the effect that the price change would otherwise have on the index. Examples of corporate actions include rights or entitlement issues, consolidations, stock splits and capital repayments.

**Corporate Event**

A *Corporate Event* arises as a result of a company announcing a course of action that could result in significant changes to the company. *Corporate Events* do not have a defined ex-date. Examples include acquisitions, secondary share offerings and tender offers. Some *Corporate Events* will be subject to shareholder approval by the company shareholders; if the company has made a tender offer, approval will also be required from the *Target Company* shareholders. The treatment of *Corporate Events* is set out in the index Methodology documents.

**Country Classification**

FTSE classifies countries for developmental status according to a transparent rules-based process that assesses each country against a set of Quality of Markets criteria. Countries are classified as Developed, Advanced Emerging, Secondary Emerging or Frontier. The Country Classification Matrix can be found at: [FTSE Country Matrix](#).

**Cumulative Market Capitalisation**

The cumulative running percentage total of the index constituents’ float-adjusted capitalisation usually calculated in descending order of float-adjusted market capitalisation. Cumulative Market Capitalisation may be used to establish size-based percentile breakpoints for the construction of large, mid and small cap subsets of an index.

**DDS – Data Delivery System**

FTSE’s File Transfer Protocol (FTP) site, used to distribute end of day data files to clients.

**Divisor**

A component of the index calculation formula that is adjusted to account for the impact of i) *Corporate Actions and Corporate Events*, and ii) index additions and deletions on the index value. These adjustments ensure that the index values remain comparable over time. On the *Index Base Date*, the divisor is set equal to the aggregate float-adjusted market capitalisation of the index constituents divided by the chosen *Index Base Value* (e.g. 1000).

**Dummy Line**

Dummy lines are non-tradable instruments which have been temporarily created by FTSE in order to reflect a corporate event. Dummy lines are generally used to reflect the investor experience and to facilitate index replication.
**Free Float/Float**
The percentage of a company’s shares that are considered to be freely available for public purchase. Determining a company’s Free Float requires analysis and classification of the company’s shareholders. The procedures for this are described in the index methodology documents.

**Foreign Headroom**
The percentage of shares available to foreign investors as a proportion of the underlying investability weight (i.e. share investability/investability weight).

**Foreign Ownership**
In some cases, foreign ownership of a company’s equity capital may be prohibited or restricted. When foreign ownership is prohibited these securities are excluded from FTSE Russell global indices. When a limit is placed on foreign ownership that is more restrictive than the Free Float adjustment, the security will be included in the index but with a weighting which reflects the maximum holding available by foreign investors.

**FTSE4Good**
The FTSE4Good Index Series contains only constituent companies that meet globally recognised corporate responsibility standards.

**Full Market Capitalisation**
The combined value of all classes of equity capital for a company obtained by multiplying the number of shares in issue for each class by its market price and summing across the classes. No adjustments are made for Free Float or Foreign Ownership restrictions.

**Growth Company**
FTSE Russell maintains a set of country and global style Indices which allow investors to measure the performance of Growth or Value companies. Growth companies are defined as those with relatively strong growth characteristics assessed on various criteria related to past and expected future revenue and earnings growth.

**Home Country Indicators (HCI)**
In determining the nationality of a particular company when reviewing eligibility for the Russell US indices, FTSE Russell tests three home country indicators against reported assets and revenues. The three indicators are location of headquarters, location of most liquid listing and location of incorporation.

**ICB**
The Industry Classification Benchmark (ICB) is a detailed and comprehensive structure for sector and industry analysis, facilitating the comparison of companies across four levels and across national boundaries. The classification system allocates companies to the subsector whose definition closely describes the nature of its business as determined by the source of its revenue or the source of the majority of its revenue, and the appropriate sector, supersector and industry classification automatically results.
Index
The European Regulation on indices used as benchmarks¹ contains the following definition of an index:

“An ‘index’ means any figure
a. that is published or made available to the public;
b. that is regularly determined:
   i. entirely or partially by the application of a formula or any other method of calculation, or by an assessment; and
   ii. on the basis of the value of one or more underlying assets or prices, including estimated prices, actual or
      estimated interest rates, quotes and committed quotes, or other values or surveys;”.

Index Base Date
The date for which the Index Base Value applies.

Index Base Value
The arbitrary number (e.g. 1000) set on the Index Base Date as the starting value of an index.

Informative Notice
A provisional notice published on the Index Announcements page of the FTSE Russell website communicating indicative index treatment of an event which is complex or high profile in advance of implementation. A Technical Notice is released subsequent to the Informative notice confirming index treatment, once the event is considered final.

Investable Market Capitalisation
A company’s Full Market Capitalisation adjusted for Free Float restrictions and Foreign Ownership limits.

Investability Weighting
See “Free float adjustment”.

IOSCO
The International Organization of Securities Commissions.

IOSCO Principles

IPO (Initial Public Offering)
Process by which a company offers to sell shares to the public for the very first time.

Direct Listing IPO
Shares are sold directly to the public without the use of underwriters or other intermediaries, and there are no new shares issued. As a result there is no guarantee for the share sale.

Variable or Best Efforts IPO
Underwriters (in their capacity as marketing agents) agree to use their best efforts to sell all of the shares that are being offered by the issuer in the IPO. However, the underwriters only purchase from the issuer shares that its clients have agreed to buy. Any shares that have not been sold will be returned to the issuer. As a result, there is no guarantee for the full share sale.

L

Liquidity Screen
To be eligible for inclusion in a FTSE Russell index, a security must pass a liquidity screen. These screens are specific to each index series.

M

Market Adjusted Breakpoints
In some Russell US indices, new security additions, such as IPOs, are assessed against Market Adjusted Breakpoints. These breakpoints are determined by applying the performance of the Russell 3000E Index between the latest rebalance and current date to the latest reconstitution size breakpoints.

Market Capitalisation Weighted Indices
Indices in which the weight of a constituent is determined by market capitalisation adjusted for Free Float and Foreign Ownership Restrictions.

Merger
The combination of two companies to form a new company.

Methodology
The set of documents that describe how an index is determined. For FTSE indices, the Methodology documents include the index Ground Rules, the Guide to Corporate Actions and Events, the Guide to Calculation Methods, and various policy documents that set out how the index will respond to unusual events. For the Russell US indices, the Methodology is set out in the Russell US Equities Construction and Methodology document.

N

Non-Domestic Exchange (NDE) Country
Some investable companies may be incorporated in countries that do not have domestic stock exchanges or exchanges that FTSE Russell recognizes as valid. Within the Russell US indices, when assets or revenues do not match with an HCI, these companies are assigned to the countries of their most liquid listing.

Non-Linear Probability Algorithm (NLP)
The NLP is used within both the Russell style and stability products and implements a nonlinear function to standardize or normalize, the values of security characteristics on a scale ranging from zero to one. For further details see the Russell US Equity Indices Construction and Methodology document.

Non-Trading Days
Non-Trading Days are days during which a country’s primary market is closed. On such days, no prices are available. However, within global indices, country level index values are updated to reflect changing exchange rates. Indices that span more than one country will be calculated on days provided at least one country’s primary market is open.
Percentile Banding

Percentile Banding is used to create a buffer zone around the Cumulative Market Capitalisation breakpoints that are used to create large, mid and small capitalisation sub-indices from a broad universe. The use of Percentile Banding allows previous membership to be considered in order to limit unnecessary index turnover. Its use places a higher threshold for new index constituents than existing members and restricts index memberships changes to those resulting from significant movements.

Pricing Vehicle

As defined by FTSE Russell, the share class of a company with the highest two-year trading volume as of the Russell reconstitution rank date.

Rank Day

The day on which the data that determine index rebalance positions are collected. For the annual June Reconstitution of the US Russell Indices, Rank Day is preannounced and occurs in May. The security values used to determine index eligibility are taken from the close of business on that day.

Rebalance

See Review.

Rebasing

The process of scaling the time series values of two or more different indices so that they have the same value at a given point in time. Rebasing facilitates direct comparisons between the performance of the different indices.

Reconstitution

The annual process in which the Russell Indices are completely rebuilt, taking into account changes in relative size and fundamental characteristics. Reconstitution ensures that companies continue to be correctly represented within appropriate market segments and that the indices reflect the appropriate opportunity set.

Reverse Merger

A merger in which an index constituent is acquired or merged with a private, non-publicly traded company or OTC-traded company resulting in a publicly traded entity which is potentially eligible for index inclusion.

Review

The regular process (typically quarterly, semi-annually or annually) in which the eligibility and weights of constituents of FTSE indices are reassessed. The Review process ensures that the indices continue to accurately represent the market or segment that the indices are designed to measure.

Sharia (or Shariah) Indices

Sharia indices are indices designed to meet the requirements of Islamic investors, as defined by Sharia law.

Shares in issue

As used in legacy FTSE index documentation and product files, shares in issue is defined as the number of shares outstanding excluding shares held in treasury and unissued shares. In recognition that in the US, shares in issue is frequently understood to include treasury shares, this term is being replaced in FTSE Russell documentation and product files by the term shares outstanding.
Stability Probability
A measure of company “stability”, used in the calculation of the Russell Stability Indices, which split companies into those with primarily “defensive” or “dynamic” characteristics. See the Russell US Equity Indices Construction and Methodology document for further information.

Style Probability
A measure of company “style” used to separate companies into those exhibiting primarily “value” or “growth” characteristics. See the Russell US Equity Indices Construction and Methodology document for further information.

Synthetic Price
A Synthetic Price for an index constituent is used when the constituent has ceased to trade, or has yet to commence to trade, but where its value can be determined through its relationship to some other index constituent or tradable security. As an example, the shares of a Target Company may be suspended whilst an Acquisition completes, but in the cases of share, or share and cash, offers their value can be deduced from the offer terms and the share price of the Acquiring Company.

Target Company
A company which is the subject of an Acquisition or take-over. The Target Company is the firm that is being acquired.

Technical Notice (Index Announcement)
A notice published on the Index Announcements page of the FTSE Russell website communicating confirmed index treatment of a complex corporate event, changes in index membership or a change to index methodology. Full versions of Index Announcements are available to subscribed users.

Total Return Index
An index that calculates the performance of its constituents assuming that equity regular cash dividends or bond coupons are re-invested into the index on the ex-dividend date.

Tracking Stock
A line of stock issued to “track” the investment performance of a particular division, business unit, subsidiary or group of assets of the issuing company (the “parent”).

Treasury Shares
Treasury shares held by the company, either via a buy-back/repurchase program or never issued to the public. Treasury shares are excluded from the FTSE shares in issue figure.

Value Company
FTSE Russell maintains a set of country and global style Indices which allow investors to measure the performance of Growth or Value companies. Value companies are defined as those with relatively low valuation measures.

Velocity
A measure of liquidity. It is calculated as the number of shares traded over a given period divided by the free-float adjusted shares in issue at the end of that period.

Weight Adjustment Factor (WAF)
A factor applied to securities to achieve the appropriate index weighting in a non-market capitalisation indices.
